

AI IT Helpdesk Voice Agent - Max

Apex Enterprises | Implementation & Demo Test Report

Purpose: Document the completed voice-agent configuration, n8n tool integration, demo flow, and submission notes.

1. Solution Overview

The solution uses Vapi as the voice-agent interface and n8n as the backend tool/orchestration layer. The assistant is named **Max - Apex Enterprises IT Helpdesk**. The intended flow is: greeting -> employee verification -> IT troubleshooting knowledge base -> ticket creation when unresolved -> ticket status -> Tier-2 escalation -> confirmation -> professional closure.

2. Voice Agent Configuration

Setting	Configured value
Assistant	Max - Apex Enterprises IT Helpdesk
Voice platform	Vapi
Voice	Elliot
Greeting	Thank you for calling Apex Enterprises IT Support. This is Max, your virtual IT assistant. How can I help you today?
Verification	Employee ID + work email before account-specific actions
Knowledge areas	Password reset, VPN setup/troubleshooting, printer setup/troubleshooting

3. n8n Tool Integration

Tool	Purpose	Endpoint
verify_employee	Verify employee identity	/webhook/ithelpdesk/verify_employee
create_it_ticket	Create unresolved-issue ticket	/webhook/ithelpdesk/create_it_ticket
check_ticket_status	Retrieve ticket status	/webhook/ithelpdesk/check_ticket_status
escalate_case	Escalate case to Tier-2	/webhook/ithelpdesk/escalate_case
send_confirmation	Send ticket/escalation confirmation	/webhook/ithelpdesk/send_confirmation

4. Demo Test - Resolved Without Ticket

Caller: “Hi, I need help resetting my password.”

Caller: Provides Employee ID and work email when requested.

Agent: Verifies the employee and provides password-reset guidance.

Caller: Confirms the password was successfully reset.

Expected result: Issue is resolved through self-service; no ticket is created; Max closes the call professionally.

5. Demo Test - Unresolved VPN to Escalation

Step	Demo action
1	“Hi, I need help with my VPN.”
2	Provide Employee ID and work email for verification.

Step	Demo action
3	Explain that the VPN is not connecting and company resources are inaccessible.
4	Confirm basic troubleshooting was attempted and the issue remains unresolved.
5	Say: "No, the issue is still not resolved. Please create an IT ticket."
6	If asked for urgency, say: "High priority, because I need VPN access to do my work."
7	Ask: "Can you check the status of that ticket?"
8	Say: "The issue is still unresolved. Please escalate this to Tier 2."
9	If asked for severity, say: "High severity."
10	Request confirmation to be sent to the work email.
11	Close with: "No, that's all. Thank you."

6. Submission Notes

The original assessment specifies xAI Voice Agent Playground and a Twilio-linked telephony path. The working demo described in this report uses Vapi for the voice interface because the xAI voice runtime required account credits. The n8n backend remains the tool layer. This substitution should be disclosed transparently in the submission rather than represented as an xAI/Twilio implementation.

7. Evidence Checklist

Evidence	Status
n8n workflow / webhook configuration	Ready
Vapi Max assistant configuration screenshot	Capture
Five tool configurations	Capture
Resolved password-reset demo	Record
Unresolved VPN -> ticket -> escalation demo	Record
Ticket ID readback	Show in recording
Confirmation step	Show in recording
Professional call closure	Show in recording

Final reminder: Before submitting, verify that the recording visibly demonstrates the actual tool calls/results and that the submission accurately states which platform was used for the voice layer.
